

## Creating a Topographic map from a Landform feature.

### Target:

### Procedure:

- 1 Add 800ml of colored water to the landforms container. The water should be at a level equal to the base of the landform mold.
- 2 Trace an outline of the water level as it interacts with the landform on the diagram below.
- 3 Add 100ml of water and trace the outline again.
- 4 Repeat that procedure until the water level overtops the landform.

Repeat the procedure with another landform mold.
